KuGou Unlocker

USER MANUAL

Turn encrypted KuGou downloads into normal music files that play anywhere

Three clicks · No command line · Fully lossless · Fully offline · Windows / macOS

Developer: shushuu (鼠鼠shushuu)

Project home: <https://github.com/p2109220548-ctrl/kugou-unlock-en>

Personal use only · No commercial use · Do not redistribute decrypted output

This manual is bound to the built-in integrity check: if the program or documents are altered, the software refuses to run. Always get original copies from the project page above.

Developed by shushuu (鼠鼠shushuu) · Personal use only · No commercial use · Do not redistribute

1. What is this?

Songs you download from the KuGou desktop client are encrypted (.kgm / .kgma / .vpr / .kgg) and only play inside KuGoo — copy them to a car stereo, phone, USB stick or lossless player and you get “format not supported”. This tool restores those encrypted songs into normal FLAC / MP3 files that play anywhere.

Decrypt	.kgm / .kgma / .vpr / .kgg → FLAC / MP3 / WAV / OGG / M4A
Fully lossless	Byte-for-byte restore of the original audio stream — zero quality loss
Auto-locate	Finds your KuGou download folder and key database automatically
GUI	Double-click to open, three clicks to convert; select all or pick files in a folder
Batch + parallel	Convert a whole folder at once, automatically multi-threaded
Optional transcode	Convert to MP3 320k etc. when FFmpeg is installed
Privacy	Runs fully locally — nothing is ever uploaded

2. Installation

Option 1: one-click script install (recommended • no command line)

- Download the ZIP and extract it: project page → green Code button → Download ZIP; right-click the ZIP and extract everything.
- Windows: double-click install_windows.bat and wait — it automatically installs Python (downloading the official installer silently if missing), installs two small components, and creates a “KuGou Unlocker” desktop shortcut.
- macOS: double-click install_mac.command (if macOS blocks it: right-click → Open → Open).
- Then double-click “KuGou Unlocker” on the desktop (mac: start_kugou_unlocker.command in the folder) and the app opens.

No command-line knowledge needed: after double-clicking, type nothing and fill in nothing — the wizard runs every step itself. If it fails to download Python automatically it opens the official download page; install from there and run install_windows.bat once more.

Option 2: command-line install (advanced users)

Install Python 3.11+ first, then in the project folder run:

```
pip install -r requirements.txt
python kugou_unlock_gui.py
```

Converting only .kgm / .kgma / .vpr needs no extra components; MP3 output requires FFmpeg (ffmpeg.org).

3. Using the app (graphical interface)

Open the app and follow ①②③:

- ① Choose files to convert: click “Find my KuGou folder” — the tool locates your KuGou download directory automatically. When found, a file picker window opens listing every encrypted song in the folder, all pre-selected — use “Select all” for everything, or hold Ctrl / Shift to pick just a few, then click OK. You can also use “Choose files...” for direct multi-select, or “Choose a folder...” which opens the same picker.
- ② Choose where to save: click “Choose output folder...” and point it where the converted songs should go.
- ③ Pick a format and hit “Start conversion” : keep “Keep original format” (fully lossless); when the progress bar finishes, click “Open output folder” to see your songs.

macOS notes: the KuGou mac client saves downloads into the KuGou subfolder of your Music folder. If it warns about a missing key database, use “Locate key database...” and pick KGMusicV3.db (no db? play each song once in the KuGou mac client first, then retry).

Command line (optional):

```
python kugou_unlock.py "C:\KuGou\KugouMusic" decrypted/
python kugou_unlock.py src/ out/ --fmt mp3
python kugou_unlock.py src/ out/ --only kgm,kgg --procs 8
```

4. FAQ

- “ekey not found for this file” : open KuGou and play / re-download that song once — the key is written to the local database — then retry.
- “KuGou key database not found” : the KuGou client is not installed on this computer. Required for .kgg; .kgm / .kgma / .vpr work without it.
- Double-clicking .py / .bat does nothing: run install_windows.bat once first; then use the “KuGou Unlocker” desktop shortcut or start_kugou_unlocker.bat.
- Want MP3: choose MP3 output in the app (needs FFmpeg). Most of the time “keep original format” is the best choice.
- Does conversion lose quality: no — decryption just removes the encryption wrapper; the music inside is untouched.

5. Integrity protection (anti-tampering)

This software ships with built-in integrity verification: every program and document file carries a developer-issued checksum manifest (SHA-256 + HMAC-anchored). Every launch verifies it — if any file was modified, replaced or deleted, the software refuses to run and asks you to re-download from the official page: <https://github.com/p2109220548-ctrl/kugou-unlock-en>

This prevents tampered copies from impersonating the original tool. If you ever see the integrity-failure message, do not trust unofficial “fixed” versions.

6. Legal

- Developed by shushuu (鼠鼠shushuu): no commercial use — personal use only; keep the attribution and LICENSE when sharing.
- Only for local files you legitimately own (downloaded with your own account); decrypted output is for private playback — do not redistribute or use commercially.
- The project contains no payment-bypass logic: .kgg keys come entirely from the key database already generated by your local KuGou client.
- By using this project you agree to comply with the laws of your jurisdiction and the platform's terms of service.
