KuGou Unlocker

USER MANUAL

Version v2.4.0 · October 2026

Turn encrypted KuGou downloads into normal music files that play anywhere

Three clicks · No command line · Beginner-friendly · Fully lossless · Fully offline · Windows / macOS

Developer: shushuu (鼠鼠shushuu)

Project home: <https://github.com/p2109220548-ctrl/kugou-unlock-en>

Personal use only · No commercial use · Do not redistribute decrypted output

This manual is bound to the built-in integrity check: if the program or documents are altered, the software refuses to run. Always get original copies from the project page above.

Developed by shushuu (鼠鼠shushuu) · Personal use only · No commercial use · Do not redistribute

1. What is this?

Songs you download from the KuGou desktop client are encrypted (file extensions .kgm, .kgma, .vpr, .kkg). They only play inside KuGoo — copy them to a car stereo, phone, USB stick, or lossless player and you get “format not supported”. This tool restores those encrypted songs into normal FLAC / MP3 files that play anywhere.

Never coded? Never touched a command line? That's completely fine — this tool was built for you. Double-click the installer, wait for it to finish, then click three buttons. That's all.

Fully lossless	The output is byte-for-byte the file you downloaded — zero quality loss
Three clicks	Open the app → pick files → hit start; select all or pick files in a folder
Auto-locate	Finds your KuGou download folder and key database automatically
No internet	Everything happens on your own computer; your music is never uploaded
Batch + parallel	Convert a whole folder at once, automatically multi-threaded
Optional transcode (FFmpeg)	Only needed to convert FLAC / WAV into MP3 320k etc.

2. Beginner tutorial (no code involved)

Step 0: check two things

- You're on Windows (Win10 / Win11) or macOS (☐ marks the mac differences).
- The KuGou desktop client is installed (the “keys” for .kkg songs live inside it; not needed if you only process .kgm / .kgma / .vpr files).

Step 1: download this tool

Open the project page <https://github.com/p2109220548-ctrl/kugou-unlock-en>, click the green Code button → Download ZIP. Then right-click the ZIP → Extract all to somewhere easy to find (e.g. Desktop).

Option 1: one-click script install (recommended • double-click only)

- Open the extracted folder.
- Windows: double-click install_windows.bat and follow the Windows steps below; macOS: double-click install_mac.command and follow the mac steps below.
- When it's done: Windows — double-click “KuGou Unlocker” on the desktop; macOS — double-click start_kugou_unlocker.command in the folder. The app opens!

☐ Windows detailed install steps

- Double-click install_windows.bat — an installer window opens; you only ever press Enter and number keys, no commands to type.
- Checking Python (wizard step 1 of 3): the wizard looks for an existing Python automatically — if it prints “Python found”, do nothing; if it prints “No Python 3.11+ detected” a three-way menu appears: just press Enter (or type 1) = install the official Python bundled

with this package (offline installer inside the tool, no internet needed; about 1-2 minutes; small windows flashing briefly are normal); type 2 = "I already have Python", then drag your python.exe straight into the wizard window and press Enter (the path fills itself in; below 3.11 it asks for confirmation); type 3 = skip installing Python for now, and re-run this installer whenever you're ready.

- Installing components (step 2 of 3): the two small packages needed for .kgg (pycryptodome / numpy) are installed automatically, once only.
- Creating the shortcut (step 3 of 3): a "KuGou Unlocker" icon appears on your desktop.
- When you see the green "Installation complete!", everything is installed.

□ If the bundled installer is missing and the online download fails too, the wizard opens the official download page; install from there (remember to tick Add python.exe to PATH) and double-click install_windows.bat once more. To launch later, you can also double-click start_kugou_unlocker.bat in the folder. If the one-click install fails, install Python manually with the reference below, then run the installer once more.

Manual Python install reference (when the one-click install fails)

- Open the download page <https://www.python.org/downloads/> and click the Python 3.x.x text link — it always points to the latest stable release.
- □□ Do NOT click the big yellow "Download Python install manager" button at the top — that's the new install manager, whose screens don't match this tutorial. Can't find the link? Open <https://www.python.org/downloads/latest/> and click "Windows installer (64-bit)".
- □ macOS: on the same page pick the macOS 64-bit universal2 installer instead; requires macOS 10.13 or newer, one installer covers both Intel and Apple Silicon (M1/M2/M3/M4...) chips — nothing to tick, it just works.
- Run the installer and — most important step — tick Add python.exe to PATH at the bottom (□ macOS has no such step, just install), click Install Now and wait for it to finish.
- To verify: press Win + R, type cmd, press Enter, then type python --version — seeing a version number means success (□ macOS: open Terminal and run python3 --version).

□ macOS detailed install steps

- Double-click install_mac.command — a Terminal window opens and the install starts automatically. Type nothing, nothing to understand; just wait until the text stops scrolling (a minute or two) and it's done.
- If the first double-click says "cannot verify the developer" / "cannot be opened" (macOS blocks every unsigned file once — the file itself is fine), pick either fix: right-click (or Control-click) the file → Open → click Open again in the dialog — allow it once and normal double-clicks work from then on; newer macOS (version 15 and up) may have no "Open" option, or still refuse after it: open System Settings → Privacy & Security, scroll down to the "install_mac.command was blocked" notice, click Open Anyway → enter your login

password.

- If it says you don't have permission to run it (Permission denied): open the Terminal app, type `chmod +x` — note the space after `+x` — then drag `install_mac.command` straight into the Terminal window (the full path fills itself in) and press Enter; no error message means success. Go back and double-click again.
- When it's done, double-click `start_kugou_unlocker.command` in the folder to launch (the first launch may hit the same "unidentified developer" block — allow it once as above).

Option 2: command-line install (advanced users)

Already comfortable with a terminal? Do it manually (same result as Option 1): install Python 3.11+ (see the reference above), open a terminal inside the extracted folder, and run:

```
pip install -r requirements.txt
python kugou_unlock_gui.py
```

□ macOS: use `python3` instead of `python` in Terminal. Converting only `.kgm` / `.kgma` / `.vpr` files? You can skip the components entirely; they're needed for `.kkg`. Want to convert the unlocked FLAC / WAV songs into MP3? That's when you need FFmpeg (ffmpeg.org).

3. Step 2: three clicks and you're done

The window shows three steps — just follow the numbers:

- ① Choose files to convert: first try "Find my KuGou folder" — the tool locates your KuGou download directory automatically (it reads KuGou's own settings and scans the common locations on every drive, C:, D:, ...). When found, a file picker window opens listing every encrypted song in that folder, all pre-selected by default — use "Select all" for everything, or hold Ctrl / Shift to pick just a few, then click OK. You can also use "Choose files..." for direct multi-select, or "Choose a folder..." which opens the same picker. □ macOS: the KuGou mac client saves downloads into the KuGou subfolder of your Music folder. If it warns about a missing key database, use "Locate key database..." , press Cmd + Shift + G, type `~/Library/Application Support`, and pick `KGMusicV3.db` from the KuGou folder there (no db? play each song once in the KuGou mac client first, then retry).
- ② Choose where to save: "Choose output folder..." and point it where the converted songs should go (e.g. a new "My Music" folder on the desktop).
- ③ Pick a format and hit "Start conversion" : keep the default "Keep original format" (fully lossless) and watch the progress bar.

When it finishes you'll get a summary — click "Open output folder" at the bottom to see your songs. Copy them to your car, phone, or player and enjoy.

Command line (optional):

```
python kugou_unlock.py "C:\KuGou\KugouMusic" decrypted/
python kugou_unlock.py src/ out/ --fmt mp3
python kugou_unlock.py src/ out/ --only kgm,kkg --procs 8
```

4. FAQ

Q: Does conversion lose quality?

A: No. "Conversion" here just removes the encryption wrapper — the music inside is untouched. Only choosing "MP3" output turns it into a lossy format.

Q: Will I get MP3 or FLAC?

A: It depends on the quality tier you picked in KuGou. "Lossless" downloads give FLAC; standard tier gives MP3. This tool cannot magically add quality.

Q: Which encrypted formats are supported?

A: .kgm, .kgma, .vpr and .kgg — all KuGou encryption formats. Normal music files (MP3/FLAC) don't need this tool and won't work with it.

Q: Can I convert a whole folder at once?

A: Yes — click "Choose a folder..." , pick your KuGou download directory, and the picker window lists every song with all pre-selected by default. Click OK and go.

Q: It says "ekey not found for this file" ?

A: Open KuGou and play or re-download that song once, then retry. The keys for .kgg are stored locally by KuGou while you listen.

Q: It warns "KuGou key database not found" ?

A: The KuGou client isn't installed on this computer. It's required for .kgg files; .kgm / .kgma / .vpr work without it.

Q: One particular file always fails to convert?

A: The song is most likely an incomplete download, or was never played in KuGou (missing key). Play it once or re-download it in KuGou, then retry just that file; other songs are unaffected.

Q: Conversion is slow / lots of files — how long will it take?

A: A single song takes seconds; hundreds may take several minutes to a quarter of an hour, depending on your machine. The components installed by the one-click script speed it up, and you should keep the window open while converting.

Q: I want MP3 output?

A: Choose "MP3" in the interface — but install FFmpeg first (restart the app afterwards). Most of the time "keep original format" is the best choice anyway.

Q: The converted songs show no cover art or title on my phone / car stereo?

A: Cover art and titles come from the tags inside the music file itself — some old songs simply don't have them. Use a mainstream player that reads tags; the file itself is fine.

Q: Double-clicking install_windows.bat flashes and disappears / does nothing?

A: Try right-click → Run as administrator first; if your antivirus pops a warning, see the next item.

Q: Antivirus / Windows Defender flags or deletes the file?

A: That's a false positive. This is an open-source script without a purchased code signature, and some antivirus products are sensitive to "auto-installer" scripts. Choose "trust / restore" for this tool in

your antivirus, and make sure you downloaded it from the official page — never trust versions from other sources.

Q: Double-clicking the .py file does nothing?

A: Run `install_windows.bat` once first, then use the “KuGou Unlocker” desktop shortcut, or double-click `start_kugou_unlocker.bat`.

Q: I installed Python but the installer says it can't find it?

A: The script only checks PATH and common install locations (portable or Conda installs are not found). Type 2 at the three-way menu and drag your `python.exe` into the window to point at it.

Q: The desktop shortcut wasn't created?

A: No problem — double-click `start_kugou_unlocker.bat` in the folder to open the app, or run the one-click installer once more to create it.

Q: Does converting need internet? Administrator rights?

A: Conversion is fully offline — your music is never uploaded; only installing Python and the components needs internet. Administrator rights are normally not required (Python installs into your own user folder).

Q: How do I uninstall this tool?

A: It's portable — deleting the extracted folder and the desktop shortcut is the whole uninstall; nothing is written to the registry. The Python and components installed earlier stay where they are and don't affect anything else.

Q: Can I use it on another computer?

A: Yes — download, extract and run the one-click installer there. Note that .kgg keys follow KuGou: the new computer needs KuGou installed and those songs played once, or there is no key in the database.

Q: Someone is selling this tool, or offering a “paid unlocked version” ?

A: This tool is fully open-source and free — there is nothing to pay for; any sale is an impersonation. Refuse it and report it on the official page, and never pay for unofficial “fixed” versions.

Q: It says “Integrity check failed” at startup?

A: Some program or document file has been modified or damaged (or the download was incomplete). Please download a fresh ZIP from the official page and extract it again — never trust unofficial “fixed” versions.

5. Integrity protection (anti-tampering)

This software ships with built-in integrity verification: every program and document file carries a developer-issued checksum manifest (SHA-256 checksums + Ed25519 asymmetric signature — the signing private key is held by the developer only and never ships with the software), verified on every launch. If any file was modified, replaced or deleted, the software refuses to run and asks you to re-download from the official page:

<https://github.com/p2109220548-ctrl/kugou-unlock-en>

Why this layer of encryption? For software safety — to prevent tampering and misuse:

- Anti-tampering: stops anyone from modifying the program, slipping anything else inside, and passing it off as this tool.
- Anti-misuse: stops anyone from repackaging or renaming this tool, or even charging you money for it — a modified file fails verification and is refused on the spot.

This PDF manual likewise carries multiple layers of watermarks (attribution and source marks) for the same purpose — anti-misuse and traceability: if someone ever lifts the manual and passes it off as their own tutorial, the watermark proves where it came from. Watermarks do not affect reading.

Important: this tool is fully open-source and free — there is nothing to pay for.

- Downloading, installing, using and updating from the official page (this repository) costs nothing — no payment, no unlock codes, no membership
- The program contains no “paid edition” , “unlock code” or “VIP group” of any kind
- Anyone selling this tool or offering a “paid unlocked version” is an impersonator — refuse it, and feel free to report it on the official page
- If you ever see the integrity-failure message, do not trust unofficial “fixed” versions

6. Legal

- This tool is developed by shushuu (鼠鼠shushuu): no commercial use — personal use only; keep the attribution and the LICENSE file when sharing.
- This tool is intended only for local files you legitimately own (downloaded with your own account), for personal playback and other fair uses.
- Decrypted output is for private use only — do not redistribute, share, or use commercially.
- The project contains no payment-bypass logic: .kgg keys come entirely from the key database already generated by your local KuGou client.
- This tool is open-source and completely free — there is nothing to pay for: anyone selling it, bundling it with charges, or offering “paid unlocks” is an impersonator, not the developer — refuse and report on the official page.
- By using this project you agree to comply with the laws of your jurisdiction and the platform's terms of service.
